

The image shows a Hammonds Model 600 additive injection system. It is a complex mechanical device with a central body and two side-mounted metering pumps. Each pump has a yellow handle and a sight flow indicator. The central body has two large yellow dials for adjusting the flow rate of each additive. A "MADE IN U.S.A." label with an American flag is visible on the front. The device is mounted on a flange and has various fittings and hoses connected to it. The background is a gradient of blue and green.**Hammonds**[®]

MODEL 600

The “Perfect” Replacement

Fluidpower

ADDITIVE INJECTION

- Vertical or horizontal flow
- 1S-1S Pump for two additives shown on standard pump frame
- Compression tube fittings on inlet of each pump
- Calibration Gauge or Sight Flow indicators available for added convenience
- 3-way valve on each pump discharge
- Additive is injected before the fluid motor to ensure complete blending of the additive

Don't let lack of parts or service keep you from providing premium additive blends to your customer. The Hammonds Model 600 can replace your Dosmatic TurboDos injection system and keep you delivering multiple additives simultaneously or individually on demand. The Model 600 is a fluid powered additive injection system that blends your additive directly into the product stream, proportionate to your product flow rate. A hard anodized aluminum fluid motor housing capable of handling product flow rates up to 250 gpm is a robust addition to your fueling system. Each additive metering pump can be adjusted from 0-1500 ppm to allow you the ability to inject one or two additives at different set points. If two additives do not give you enough options, we can provide up to 4 pumps, each capable of injecting up to 1500 ppm. Hammonds flexibility allows you to turn your additive sales into a profit center by being able to selectively inject additives on demand to those customers that realize the benefits of a premium additive package.
